

1.1_INT-WFC

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Isaac Newton Telescope / Wide Field Camera (INT/WFC) data

Isaac Newton Telescope / Wide Field Camera (INT/WFC) catalogue: the catalogue comes from dmu0_INTWFC.

In the catalogue, we keep:

- The identifier (it's unique in the catalogue);
- The position;
- The stellarity;
- The magnitude for each band in aperture 4 ($1.2 * \sqrt{2}$ arcsec = 1.7 arcsec).
- The kron magnitude to be used as total magnitude (no “auto” magnitude is provided).

We don't know when the maps have been observed. We will use the year of the reference paper.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Column selection

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/ipykernel/_main_.py:8: R
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/ipykernel/_main_.py:9: R
```

Out[6]: <IPython.core.display.HTML object>

1.3 II - Removal of duplicated sources

We remove duplicated objects from the input catalogues.

The initial catalogue had 949159 sources.

The cleaned catalogue has 948771 sources (388 removed).

The cleaned catalogue has 388 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.06007787097246364 arcsec

Dec correction: -0.12125572829972953 arcsec

1.5 IV - Flagging Gaia objects

43952 sources flagged.

1.6 V - Flagging objects near bright stars

2 VI - Saving to disk

1.2_RCSLenS

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Red Cluster Sequence Lensing Survey (RCSLenS) data

This catalogue comes from dmu0_RCSLenS.

In the catalogue, we keep:

- The id as unique object identifier;
- The position;
- The g, r, i, z, y auto magnitudes.

1.1.1 Strange magnitudes

The missing values seems to be encoded as -99. but there are also quite some 99. magnitudes.

The “sensible” range of magnitudes seems to go from 14 to 37 (depending on the bands and given that 37 is really faint and may not be reliable). In addition to that there are some very low magnitudes under -40. and very high ones above 90. We don’t know the meaning of these extreme values so we are removing all the negative magnitudes and those above 80.

We are also removing the sources for which we have no magnitude information given the modifications above.

```
This notebook was run with herschelhelp_internal version:  
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)
```

1.2 I - Column selection

```
Out[6]: <IPython.core.display.HTML object>
```

1.2.1 1.1 Remove all nan rows

```
481360 out of 2607590 objects removed due to all nan magnitudes.
```

1.3 II - Removal of duplicated sources

We remove duplicated objects from the input catalogues.

The initial catalogue had 2126230 sources.

The cleaned catalogue has 2052639 sources (73591 removed).

The cleaned catalogue has 72807 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.07070391181969171 arcsec

Dec correction: -0.1302633008947396 arcsec

1.5 IV - Flagging Gaia objects

27935 sources flagged.

1.6 V - Flagging objects near bright stars

2 VI - Saving to disk

1.3_PanSTARRS-3SS

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Pan-STARRS1 - 3pi Steradian Survey (3SS) data

This catalogue comes from dm0_PanSTARRS1-3SS.

In the catalogue, we keep:

- The uniquePspSSTid as unique object identifier;
- The r-band position which is given for all the sources;
- The grizy <band>FApMag aperture magnitude (see below);
- The grizy <band>FKronMag as total magnitude.

The Pan-STARRS1-3SS catalogue provides for each band an aperture magnitude defined as “In PS1, an ‘optimal’ aperture radius is determined based on the local PSF. The wings of the same analytic PSF are then used to extrapolate the flux measured inside this aperture to a ‘total’ flux.”

The observations used for the catalogue were done between 2010 and 2015 ([ref](#)).

TODO: Check if the detection flag can be used to know in which bands an object was detected to construct the coverage maps.

TODO: Check for stellarity.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Column selection

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
    ma.MaskedArray.__setitem__(self, index, value)
```

Out [6]: <IPython.core.display.HTML object>

1.3 II - Removal of duplicated sources

We remove duplicated objects from the input catalogues.

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
    ma.MaskedArray.__setitem__(self, index, value)
```

The initial catalogue had 435078 sources.

The cleaned catalogue has 434925 sources (153 removed).

The cleaned catalogue has 153 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.0006137910020242998 arcsec

Dec correction: -0.00026867304541156045 arcsec

1.5 IV - Flagging Gaia objects

55984 sources flagged.

1.6 V - Flagging objects near bright stars

2 VI - Saving to disk

1.4_SpARCS

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Spitzer Adaptation of the Red-sequence Cluster Survey (SpARCS) data

This catalogue comes from dmu0_SpARCS. Alexandru Tudorica confirmed that the magnitudes are AB ones and are not aperture corrected.

In the catalogue, we keep:

- The internal identifier (this one is only in HeDaM data);
- The position;
- The ugrz magnitudes in the 8th aperture ($11 \times 0.186 = 2.046$ arcsec).
- The “auto” magnitudes.

The maps on the web page indicate they were observed in 2012 (or late 2011). Let’s use 2012 as epoch.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Parametres for aperture correction

To compute aperture correction we need to determine two parameters: the target aperture and the range of magnitudes for the stars that will be used to compute the correction.

Target aperture: To determine the target aperture, we simulate a curve of growth using the provided apertures and draw two figures: - The evolution of the magnitudes of the objects by plotting on the same plot aperture number vs the mean magnitude. - The mean gain (loss when negative) of magnitude is each aperture compared to the previous (except for the first of course).

As target aperture, we should use the smallest (i.e. less noisy) aperture for which most of the flux is captured.

Magnitude range: To know what limits in aperture to use when doing the aperture correction, we plot for each magnitude bin the correction that is computed and its RMS. We should then use the wide limits (to use more stars) where the correction is stable and with few dispersion.

WARNING: UnitsWarning: '""' did not parse as fits unit: Invalid character at col 0 [astropy.unit

1.2.1 I.a r-band

We will use the 16th (aperture number above begin to 0) aperture as target.

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:131: RuntimeWarning: invalid value encountered in less than or equal to  
mask &= (mag >= mag_min)  
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:133: RuntimeWarning: invalid value encountered in less than or equal to
```

```
mask &= (mag <= mag_max)
```

We use magnitudes between 17 and 17.9.

1.2.2 I.b u-band

We will use the 16th (aperture number above begin to 0) aperture as target. Should we use the 12nd because of the increasing magnitude?

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:131: RuntimeWarning: invalid value encountered in less than or equal to  
mask &= (mag >= mag_min)
```

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:133: RuntimeWarning: invalid value encountered in less than or equal to
mask &= (mag <= mag_max)
```

We use magnitudes between 17 and 17.9.

1.2.3 I.c g-band

We will use the 16th (aperture number above begin to 0) aperture as target.

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:131: RuntimeWarning: invalid value encountered in less than or equal to  
mask &= (mag >= mag_min)  
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:133: RuntimeWarning: invalid value encountered in less than or equal to
```

```
mask &= (mag <= mag_max)
```

We use magnitudes between 17.2 and 18.

1.2.4 I.d z-band

We will use the 16th (aperture number above begin to 0) aperture as target.

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:131: RuntimeWarning: invalid value encountered in less than or equal to  
mask &= (mag >= mag_min)  
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:133: RuntimeWarning: invalid value encountered in less than or equal to
```

```
mask &= (mag <= mag_max)
```

We use magnitudes between 16 and 17.

37513 sources flagged.

1.7 V - Flagging objects near bright stars

1.8 VI - Saving to disk

1.5_UKIDSS-DXS

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of UKIRT Infrared Deep Sky Survey / Deep Extragalactic Survey (UKIDSS/DXS)

The catalogue comes from `dmu0_UKIDSS-DXS_DR10plus`.

In the catalogue, we keep:

- The identifier (it's unique in the catalogue);
- The position;
- The stellarity;
- The magnitude for each band in aperture 3 (2 arcsec).
- The kron magnitude to be used as total magnitude (no “auto” magnitude is provided).

The magnitudes are “*Vega like*”. The AB offsets are given by Hewett *et al.* (2016):

Band	AB offset
J	0.938
H	1.379
K	1.900

A query to the UKIDSS database with 242.9+55.071 position returns a list of images taken between 2007 and 2009. Let's take 2008 for the epoch.

This notebook was run with `herschelhelp_internal` version:
`44f1ae0` (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Column selection

WARNING: UnitsWarning: 'degrees' did not parse as fits unit: At col 0, Unit 'degrees' not supported

2 VI - Saving to disk

1.6_SWIRE

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Spitzer datafusion SWIRE data

The Spitzer catalogues were produced by the datafusion team are available in dmu0_DataFusion-Spitzer. Lucia told that the magnitudes are aperture corrected.

In the catalogoue, we keep:

We keep: - The internal identifier (this one is only in HeDaM data); - The position; - The fluxes in aperture 2 (1.9 arcsec) for IRAC bands. - The Kron flux; - The stellarity in each band

A query of the position in the Spitzer heritage archive show that the ELAIS-N1 images were observed in 2004. Let's take this as epoch.

We do not use the MIPS fluxes as they will be extracted on MIPS maps using XID+.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Column selection

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:76: RuntimeWarning: invalid value encountered in log10
  magnitudes = 2.5 * (23 - np.log10(fluxes)) - 48.6
```

Out [6]: <IPython.core.display.HTML object>

1.3 II - Removal of duplicated sources

We remove duplicated objects from the input catalogues.

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
```

```
    ma.MaskedArray.__setitem__(self, index, value)
```

The initial catalogue had 659974 sources.

The cleaned catalogue has 659925 sources (49 removed).

The cleaned catalogue has 49 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.04179821406751216 arcsec

Dec correction: -0.11961620856055788 arcsec

1.5 IV - Flagging Gaia objects

29668 sources flagged.

1.6 V - Flagging objects near bright stars

2 VI - Saving to disk

1.7 SERVS

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Preparation of Spitzer datafusion SERVS data

The Spitzer catalogues were produced by the datafusion team are available in dmu0_DataFusion-Spitzer. Lucia told that the magnitudes are aperture corrected.

In the catalog, we keep:

- The internal identifier (this one is only in HeDaM data);
- The position;
- The fluxes in aperture 2 (1.9 arcsec);
- The “auto” flux (which seems to be the Kron flux);
- The stellarity in each band

A query of the position in the Spitzer heritage archive show that the SERVS-ELAIS-N1 images were observed in 2009. Let’s take this as epoch.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.2 I - Column selection

```
/opt/herschelhelp_internal/herschelhelp_internal/utils.py:76: RuntimeWarning: invalid value encountered in log
  magnitudes = 2.5 * (23 - np.log10(fluxes)) - 48.6

We remove duplicated objects from the input catalogues.

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
    ma.MaskedArray.__setitem__(self, index, value)
```

The initial catalogue had 951102 sources.

The cleaned catalogue has 951102 sources (0 removed).

The cleaned catalogue has 0 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.16942944777724733 arcsec

Dec correction: -0.10899877246544065 arcsec

1.5 IV - Flagging Gaia objects

14350 sources flagged.

1.6 V - Flagging objects near bright stars

1.7 VI - Saving to disk

1.8_UHS

January 18, 2018

1 Lockman-SWIRE master catalogue

1.1 Preparation of UKIRT Hemisphere Survey (UHS) data

The catalogue comes from `dmu0_UHS`. This is a J band only survey documented in <https://arxiv.org/pdf/1707.09975.pdf>

In the catalogue, we keep:

- The identifier (it's unique in the catalogue);
- The position;
- The stellarity;
- The magnitude for each band in aperture 4 (2 arcsec aperture corrected).
- The kron magnitude to be used as total magnitude (no “auto” magnitude is provided).

We don't know when the maps have been observed. We will use the year of the reference paper.

This notebook was run with `herschelhelp_internal` version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

0.925175419285

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
    ma.MaskedArray.__setitem__(self, index, value)
```

`Out[7]: <IPython.core.display.HTML object>`

1.3 II - Removal of duplicated sources

We remove duplicated objects from the input catalogues.

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/astropy/table/column.py:10
Check the NumPy 1.11 release notes for more information.
    ma.MaskedArray.__setitem__(self, index, value)
```

The initial catalogue had 195229 sources.

The cleaned catalogue has 182619 sources (12610 removed).

The cleaned catalogue has 12112 sources flagged as having been cleaned

1.4 III - Astrometry correction

We match the astrometry to the Gaia one. We limit the Gaia catalogue to sources with a g band flux between the 30th and the 70th percentile. Some quick tests show that this give the lower dispersion in the results.

RA correction: -0.07215760333565413 arcsec

Dec correction: -0.12638207908679533 arcsec

1.5 IV - Flagging Gaia objects

49470 sources flagged.

2 V - Saving to disk

2_Merging

January 18, 2018

1 Lockman SWIRE master catalogue

This notebook presents the merge of the various pristine catalogues to produce HELP master catalogue on Lockman SWIRE.

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

1.1 I - Reading the prepared pristine catalogues

1.2 II - Merging tables

We first merge the optical catalogues and then add the infrared ones: WFC, DXS, SpARCS, HSC, PS1, SERVS, SWIRE.

At every step, we look at the distribution of the distances to the nearest source in the merged catalogue to determine the best crossmatching radius.

1.2.1 WFC

1.2.2 Add RCSLenS

1.2.3 Add PanSTARRS

1.2.4 Add SpARCS

1.2.5 Add DXS

1.2.6 Add SERVS

1.2.7 Add SWIRE

1.2.8 Add UHS

1.2.9 Cleaning

When we merge the catalogues, astropy masks the non-existent values (e.g. when a row comes only from a catalogue and has no counterparts in the other, the columns from the latest are masked for that row). We indicate to use NaN for masked values for floats columns, False for flag columns and -1 for ID columns.

Out[21]: <IPython.core.display.HTML object>

1.3 III - Merging flags and stellarity

Each pristine catalogue contains a flag indicating if the source was associated to another nearby source that was removed during the cleaning process. We merge these flags in a single one.

Each pristine catalogue contains a flag indicating the probability of a source being a Gaia object (0: not a Gaia object, 1: possibly, 2: probably, 3: definitely). We merge these flags taking the highest value.

Each pristine catalogue may contain one or several stellarity columns indicating the probability (0 to 1) of each source being a star. We merge these columns taking the highest value.

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/numpy/lib/nanfunctions.py:  
    warnings.warn("All-NaN slice encountered", RuntimeWarning)
```

1.4 IV - Adding E(B-V) column

1.5 V - Adding HELP unique identifiers and field columns

OK!

1.6 VI - Cross-matching with spec-z catalogue

1.7 VII - Choosing between multiple values for the same filter

Both SERVS and SWIRE provide IRAC1 and IRAC2 fluxes. SERVS is deeper but tends to underestimate flux of bright sources (Mattia said over 2000 μ Jy) as illustrated by this comparison of SWIRE, SERVS, and Spitzer-EIP fluxes.

```
WARNING: UnitsWarning: 'e/count' did not parse as fits unit: At col 0, Unit 'e' not supported by
WARNING: UnitsWarning: 'image' did not parse as fits unit: At col 0, Unit 'image' not supported
```

When both SWIRE and SERVS fluxes are provided, we use the SERVS flux below 2000 Jy and the SWIRE flux over.

We create a table indicating for each source the origin on the IRAC1 and IRAC2 fluxes that will be saved separately.

```
684599 sources with SERVS flux
617006 sources with SWIRE flux
280721 sources with SERVS and SWIRE flux
683634 sources for which we use SERVS
337250 sources for which we use SWIRE
```

```
684599 sources with SERVS flux
616836 sources with SWIRE flux
280717 sources with SERVS and SWIRE flux
683570 sources for which we use SERVS
337148 sources for which we use SWIRE
```

```
732936 sources with SERVS flux
441887 sources with SWIRE flux
197895 sources with SERVS and SWIRE flux
732316 sources for which we use SERVS
244612 sources for which we use SWIRE
```

```
732936 sources with SERVS flux
441831 sources with SWIRE flux
197895 sources with SERVS and SWIRE flux
732273 sources for which we use SERVS
244599 sources for which we use SWIRE
```

1.7.1 UHS WFCAM J vs DXS WFCAM J

These both come from wfcam. If UHS is to be included (it currently is not) we will have to decide between the two. DXS is deeper so it would probably be a case of preferentially taking DXS J fluxes.

1.7.2 CFHT Megacam SpARCS vs RCSLenS

SpARCS appears to be significantly deeper and contains both total and aperture magnitudes so we take SpARCS over RCSLenS if both are available

Survey	Bands
SpARCS	ugriz
RCSLenS	grizy

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/numpy/core/numeric.py:301:

1.8 VIII.a Wavelenght domain coverage

We add a binary `flag_optnir_obs` indicating that a source was observed in a given wavelenght domain:

- 1 for observation in optical;
- 2 for observation in near-infrared;
- 4 for observation in mid-infrared (IRAC).

It's an integer binary flag, so a source observed both in optical and near-infrared by not in mid-infrared would have this flag at $1 + 2 = 3$.

Note 1: The observation flag is based on the creation of multi-order coverage maps from the catalogues, this may not be accurate, especially on the edges of the coverage.

Note 2: Being on the observation coverage does not mean having fluxes in that wavelength domain. For sources observed in one domain but having no flux in it, one must take into consideration de different depths in the catalogue we are using.

1.9 VIII.b Wavelenght domain detection

We add a binary `flag_optnir_det` indicating that a source was detected in a given wavelenght domain:

- 1 for detection in optical;
- 2 for detection in near-infrared;
- 4 for detection in mid-infrared (IRAC).

It's an integer binary flag, so a source detected both in optical and near-infrared by not in mid-infrared would have this flag at $1 + 2 = 3$.

Note 1: We use the total flux columns to know if the source has flux, in some catalogues, we may have aperture flux and no total flux.

To get rid of artefacts (chip edges, star flares, etc.) we consider that a source is detected in one wavelength domain when it has a flux value in **at least two bands**. That means that good sources will be excluded from this flag when they are on the coverage of only one band.

1.10 IX - Cross-identification table

We are producing a table associating to each HELP identifier, the identifiers of the sources in the pristine catalogue. This can be used to easily get additional information from them.

```
['wfc_id', 'rcs_id', 'ps1_id', 'sparcs_intid', 'dxs_id', 'servs_intid', 'swire_intid', 'uhs_id',
```

1.11 X - Adding HEALPix index

We are adding a column with a HEALPix index at order 13 associated with each source.

1.12 XI - Saving the catalogue

Missing columns: {'flag_wfc_u', 'flag_wfcam_j', 'flag_irac_i1', 'flag_gpc1_r', 'flag_megacam_z',

3_Checks_and_diagnostics

January 18, 2018

1 Lockman SWIRE master catalogue

1.1 Checks and diagnostics

This notebook was run with herschelhelp_internal version:
44f1ae0 (Thu Nov 30 18:27:54 2017 +0000)

Diagnostics done using: master_catalogue_lockman-swire_20171201.fits

1.2 0 - Quick checks

```
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/numpy/core/numeric.py:301:
    format(shape, fill_value, array(fill_value).dtype), FutureWarning)
/opt/anaconda3/envs/herschelhelp_internal/lib/python3.6/site-packages/numpy/core/numeric.py:301:
    format(shape, fill_value, array(fill_value).dtype), FutureWarning)
```

Table shows only problematic columns.

Out[4]: <IPython.core.display.HTML object>

1.3 I - Summary of wavelength domains

Detection of the 3,591,002 sources detected
in any wavelength domains (among 4,366,298 sources)

1.4 II - Comparing magnitudes in similar filters

The master list is composed of several catalogues containing magnitudes in similar filters on different instruments. We are comparing the magnitudes in these corresponding filters.

1.4.1 II.a - Comparing depths

We compare the histograms of the total aperture magnitudes of similar bands.

1.4.2 II.b - Comparing magnitudes

We compare one to one each magnitude in similar bands.

1.5 III - Comparing magnitudes to reference bands

Cross-match the master list to SDSS and 2MASS to compare its magnitudes to SDSS and 2MASS ones.

1.5.1 III.a - Comparing u, g, r, i, and z bands to SDSS

The catalogue is cross-matched to SDSS-DR13 withing 0.2 arcsecond.

We compare the u, g, r, i, and z magnitudes to those from SDSS using fiberMag for the aperture magnitude and petroMag for the total magnitude.

WFC u (aperture) - SDSS u (fiberMag) :

1.5.2 III.b - Comparing J and K bands to 2MASS

The catalogue is cross-matched to 2MASS-PSC withing 0.2 arcsecond. We compare the UKIDSS total J and K magnitudes to those from 2MASS.

The 2MASS magnitudes are “Vega-like” and we have to convert them to AB magnitudes using the zero points provided on [this page](#):

Band	F - 0 mag (Jy)
J	1594
H	1024
Ks	666.7

In addition, UKIDSS uses a K band whereas 2MASS uses a Ks (“short”) band, [this page](#) give a correction to convert the K band in a Ks band with the formula:

$$K_{s(2MASS)} = K_{UKIRT} + 0.003 + 0.004 * (JK)_{UKIRT}$$

WFCAM J (total) - 2MASS J:

- Median: 0.02
- Median Absolute Deviation: 0.05
- 1% percentile: -0.9130657836820437
- 99% percentile: 0.575751805124098

WFCAM Ks-like (total) - 2MASS Ks:

- Median: 0.07
- Median Absolute Deviation: 0.08
- 1% percentile: -0.8240238957842398
- 99% percentile: 0.9100533730451055

1.6 Keeping only sources with good signal to noise ratio

From here, we are only comparing sources with a signal to noise ratio above 3, i.e. roughly we a magnitude error below 0.3.

To make it easier, we are setting to NaN in the catalogue the magnitudes associated with an error above 0.3 so we can't use these magnitudes after the next cell.

1.7 IV - Comparing aperture magnitudes to total ones.

Number of source used: 2456999 / 4366298 (56.27%)

1.8 V - Color-color and magnitude-color plots

Number of source used: 85805 / 4366298 (1.97%)

Number of source used: 129379 / 4366298 (2.96%)

Number of source used: 2072647 / 4366298 (47.47%)

Number of source used: 108739 / 4366298 (2.49%)

Number of source used: 107975 / 4366298 (2.47%)

Number of source used: 38805 / 4366298 (0.89%)

4_Selection_function

January 18, 2018

1 Lockman-SWIRE Selection Functions

1.1 Depth maps and selection functions for Lockman-SWIRE

The simplest selection function available is the field MOC which specifies the area for which there is Herschel data. Each pristine catalogue also has a MOC defining the area for which that data is available.

The next stage is to provide mean flux standard deviations which act as a proxy for the catalogue's 5σ depth

```
Diagnostics done using: master_catalogue_lockman-swire_20171201.fits
```

Plotting a histogram of magnitudes gives a quick idea of depth.

```
Out[3]: <matplotlib.axes._subplots.AxesSubplot at 0x7fa9a4fc2e80>
```

and for flux

Out [4]: <matplotlib.axes._subplots.AxesSubplot at 0x7fa9a4f5be10>

Distribution of flux errors:

Out [5]: <matplotlib.axes._subplots.AxesSubplot at 0x7fa99c082f60>

Magnitude error as function of magnitude

1.2 I - Group masterlist objects by healpix cell and calculate depths

We add a column to the masterlist catalogue for the target order healpix cell per object.

`Out [9]: <IPython.core.display.HTML object>`

`Out [10]: <IPython.core.display.HTML object>`

1.3 II Create a table of all Order=13 healpix cells in the field and populate it

We create a table with every order=13 healpix cell in the field MOC. We then calculate the healpix cell at lower order that the order=13 cell is in. We then fill in the depth at every order=13 cell as calculated for the lower order cell that that the order=13 cell is inside.

Out[13]: <IPython.core.display.HTML object>

Out[15]: <IPython.core.display.HTML object>

Out[16]: <IPython.core.display.HTML object>

Out[17]: <IPython.core.display.HTML object>

1.4 III - Save the table of depth maps
